QUESTIONS
For ●●●
FIREPLACE
DOORS

WHAT IS ROBAX?

There is a specialised type of glass for situations in which glass is exposed to heat, such as fire place doors.

The glass is called Robax and this glass is a ceramic glass combination which has been heat treated to be able to with stand temperatures between

**100 Degrees &
400 Degrees Celsius.**

Why does the glass suddenly crack?

As with all glass,
**Robax weathers and can
become brittle over time.**

Especially while with standing the
temperatures of fire for example, even
though you may not be able to physically
see any damage until it actually cracks.

The process of replacing robax in a fireplace door.

The process for reglazing a fireplace door is quite simple, though there are more materials required than just robax. We can do all of this in-house, which makes it easy for customers.

As we are a full supplier of the reglaze of fire place doors, we can source the sealants to suit your specific door, as each door is different to the next.

We can provide
same day service.

With our vast amount of stock, we can offer same
day service for most fire place doors.

We know the middle of winter is far too cold for your
family to be without heat.

It is our priority to ensure your family is
safe & warm as quick as possible.
